ABSTRACT:

CHG DATE=19990617 STATUS=O>2,6-Difluorotolans of formula (I) are claimed. R1, R2= 1-18C alk(en)yl, opt. with 1 or 2 non-adjacent CH2 gps. replaced by O, S, COO or OCO; one of these gps. can also = F, Cl, CN, CF3, OCF3 or OCF2H; A1, A2= 1,4-cyclohexylene, 1,4-phenylene, 2- or 3-fluoro-1,4-phenylene, 2,3-difluoro-1,4-phenylene, 2,6- or 3,5-difluorophenylene, dioxan-2,5-diyl, pyridine-2,5-diyl or pyrimidine-2,5-diyl; Z1, Z2= -CH2CH2-, -(CH2)4-, -CH2O-, -OCH2-, -CC- or a single bond; m, p = 0, 1 or 2; o= 0, 1 or 2. USE/ADVANTAGE - (I) are useful as components of liq. crystal (LC) media for electro-optical displays. Also claimed are LC media with at least 2 components, at least one of which contains a 2,6-difluorotolan gp. as in (I), pref. a cpd. of formula (I), and electro-optical displays contg. such LC media. The incorporation of (I) gives stable LC media with relatively high optical anisotropy and pronounced positive dielectric anisotropy, useful esp. in TNC-based display elements; cpds. (I) have high chemical, thermal and light stability, and form LC mesophases in the relevant temp. range.

ABSTRACT:

PURPOSE: To provide the subject new difluorocyano compound capable of providing a chemically stable liquid crystal composition exhibiting a lowered threshold voltage and capable of lowvoltage drive.

CONSTITUTION: A compound of formula I [A is a 1,4-disubstituted phenylene (One or two or more CH may be substituted with N) which may have one or two or more halogen or methyl as substituents; R is H or a 1 to 10C alkyl (One or two or more H may be substituted with F. O may be inserted into a C-C bond including one between the substituent group and the ring)], e.g. a compound of formula 13. The above-mentioned compound can be obtained from 3,5-difluorobenzoic acid of formula 2 as the starting material by a reaction according to the reaction formula.

ABSTRACT:

PROBLEM TO BE SOLVED: To obtain a nematic liquid crystal composition which comprises two liquid crystal components containing a plurality of compounds each having specific dielectric anisotropy respectively at a specific ratio, satisfies specific conditions, realizes the rapid response and is useful as an electrooptical display material.

SOLUTION: This liquid crystal composition comprises (A) 40-80wt.% a liquid crystal component containing at least ≥ 5 kinds of tolan compounds with a dielectric anisotropy of $-2 \sim +2$ [preferably of formula I (R11 is a 2-5C straight chain alkyl; R14 is a 1-5C straight chain alkyl; Y11 is H, F, CH3)] and (B) 5-60wt.% of a liquid crystal component containing two or more compounds with a dielectric anisotropy of $\geq +2$ [preferably a compound of formula II (R21 is a 2-7C straight chain alkyl; Z21 and Z22 are each a single bond; Y21 and Y22 are each H, F; (k) is 0, 1)], and shows the dielectric anisotropy of ≥ 3 , an optical birefringence of ≥ 0.15 , the phase transition point from the nematic phase to the isotropic phase at $\geq 70^\circ\text{C}$, while that from the crystal phase or the smectic phase to the nematic phase at $\geq -10^\circ\text{C}$.

ABSTRACT:

PROBLEM TO BE SOLVED: To provide a liquid crystal device having a light-controlling layer comprising a liquid crystal and a polymer and to provide a liquid crystal device having good contrast, high voltage holding rate and excellent heat resistance.

SOLUTION: The liquid crystal device having a light-controlling layer containing a liquid crystal compsn. and a transparent polymer material held between two substrates is produced by the following method. A material for formation of a light-controlling layer containing a liquid crystal compsn. and a polymerizable component is held between two substrates having electrode layers at least one of which is transparent and the polymerizable compsn. is polymerized. (1) The liquid crystal compsn. has a specific resistance between $1 \times 10^{13} \Omega \cdot \text{cm}$ and $1 \times 10^{15} \Omega \cdot \text{cm}$ at 25°C. (2) The polymerizable compsn. has the specific resistance between $1 \times 10^{13} \Omega \cdot \text{cm}$ and $1 \times 10^{15} \Omega \cdot \text{cm}$ at 25°C.

ABSTRACT:

PURPOSE: To provide a liquid crystal mixture which comprises 2 or more of 1-(4-cyclohexylphenyl)-2-phenylethane derivatives with its melting point lowered without reduction in the upper-limit temperature of the nematic phase of this composition and precipitates no crystal even at a lowered temperature, thus is useful as a material for liquid crystal display elements.

CONSTITUTION: This mixture comprises 2 or more compounds of formula I [R1 is a 1-12C alkyl; n is 0, 1; X1-X3 are each H, deuterium (D) where at least one is D; Y1-Y5 are each H, F; Z is F, Cl; cyclohexan rings have the trans configuration], and they differ mutually in the number of D in X1-X3 and/or the substitution positions, while they are equal to each other in R1, n, Y1-Y5 and Z. One example of the compound of formula I is 1(3,4-difluorophenyl)ethyl-2,6-difluoro-4-(2,2,6-d3-trans-4-propylcyclohexyl)benzene. This compound is prepared, for example, by allowing a compound of formula II to react with deuterium and converting the resultant a mixture of formula III through a compound of formula IV to the target compound.

AB A new class of liq. crystal compds. is based on tolane and bis-tolane structures: (I, II), in which X is a polar group such as F, CN, OCF3, or NCS at least one of the pairs of sites Y1 and Y2, Z1 and Z2, and A1 and A2 are F or H groups. T1 and T2 are either both triple bonds or one of the two groups is a double bond with and the other remains a triple bond. Rn

or Rm may be an alkyl group C_nH_{2n+1} , an alkenyl group C_nH_{2n-1} , an alkoxy group OC_nH_{2n+1} , or an alkenoxy group having the general formula $-OC_nH_{2n-1}$. Addnl. Rn may be a cyclohexyl substituent (III), or a dioxane substituent (IV), in which Rp is an alkyl group having the general formula general formula C_xH_{2x+1} , an alkenyl group C_xH_{2x-1} , an alkoxy group OC_xH_{2x+1} , or an alkenoxy group OC_xH_{2x-1} . These compds. exhibit useful nematic ranges and m.ps. For example, 1-(4-butylphenylethynyl)-4-(3,4,5-trifluorophenylethynyl)benzene can be prepd. having nematic range of 115-188.degree. and fusion enthalpy of 3.85 kcal/mol. Also disclosed are eutectic mixts. including these compds.

Composition 10	0.16
Composition E	0.12

20

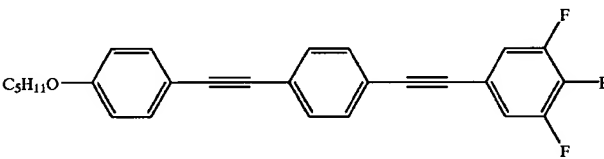

EXAMPLE 15

The compound (2-6) corresponding to the formula (2) was mixed into the composition B prepared in example 7 in the ratios shown in Table 21, resulting in a composition E.

25

The phenylacetylene compound having an alkyl group in its skeleton, and the liquid crystal composition using the compound of the present invention each have large anisotropies of refractive index, are stable, tend to be mixed into other liquid crystals, and are especially useful as a material for constituting a liquid crystal element represented by, for

TABLE 21

	wt %
Composition B	90.1
	9.9

Then, into the composition E, was mixed the compound (1-2) corresponding to the formula (1) in the ratio shown in Table 22, resulting in a liquid crystal composition 10. Subsequently, the measurement of each Δn of the liquid crystal composition 10 and the composition E was carried out at 30° C. The results are shown in Table 23.

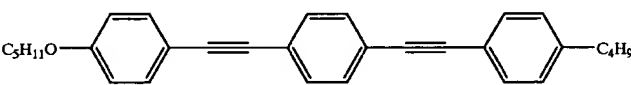

45

Table 23 reveals that the liquid crystal composition 10 of the present invention has the larger Δn , and is more excellent as compared with the composition E.

50

example, a STN (supertwisted nematic) liquid crystal element and a PDLC (polymer dispersed liquid crystal) type liquid crystal element. Further, the liquid crystal composition of the present invention includes the compound represented by the formula (2), and the compound represented by the formula (3) and/or the formula (4). Consequently, it has a large anisotropy of refractive index and is stable, and hence it is useful especially as a material for constituting a liquid crystal element represented by a STN (supertwisted nematic) liquid crystal element or a PDLC (polymer dispersed liquid crystal) type liquid crystal element.

AB Disclosed is a tolan deriv., a liq.-crystal compn. contg. the deriv., and a liq.-crystal display device using the compn., where the tolan deriv. has the general formula I, where R = C1-10 linear alkyl; X1,X2,X3,X4 = F or H and .gtoreq.1 of them is F; and Y = CN or C1-10 linear alkyl. By blending the above-described compd. with a general liq.-crystal compn., a compn. can be provided which exhibits a wide practical temp. range as well as a large anisotropy of the refractive index.

 AB The authors synthesized and studied new 3-ring phenylacetylene liq.
 crystals with high birefringence values (.DELTA.n) to improve the nematic
 temp. range while retaining a high optical anisotropy. In the case of
 modifying the terminal ring, the introduction of branched alkoxy chains, F
 or Me groups shifted the nematic phase to lower temps. In order to
 minimize the influence of the substituent on .DELTA.n, the incorporation
 of lateral Me groups was chosen as the most profitable method for
 obtaining wide and low temp. nematic phases. With these results in mind,
 the authors studied the effect of the position of the Me group on the
 phys. properties. The most effective Me position for improving the
 nematic temp. range was on the central ring. From the standpoint of
 obtaining high .DELTA.n values and low viscosity, the central ring was
 also the best position.
